We can compute this empirically as we generate samples. This is what we want to compute, and is infeasible to compute in any other way. Chapter 1 Markov Chains - Department of Statistics and ... One can interpret the state of the Markov chain as the fortune of a Gambler who repeatedly plays a game in which the Gambler wins or loses \$1 with respective probabilities  $p$  and  $q=1-p$ . If the fortune reaches state 0, the Gambler is ruined since  $p_0 = 1$  (state 0 is absorbing — the chain stays there forever).
